Lechuza Planters

How do they work?

The LECHUZA sub-irrigation system ensures that your plants receive the exact amount of water they need for optimal growth.

1. **Water level indicator** - Takes the guesswork out of watering
2. **Water supply shaft** - Makes adding water and liquid fertilizer easy
3. **LECHUZA-PON** - The substrate perfectly controls the water supply
4. **Separator** - Forms the water reservoir in the bottom of the planter
5. **Drain plug** - Is removed when used outdoors

For orchids in Lechuza pots fill the reservoir half way. The water from the reservoir is transported up to the roots through the wick. When the water is completely used up, maintain a dry phase for one week. The PON saves water and gives it to the orchid during this time.

Detailed planting and watering instructions are included in the booklet supplied with each Lechuza planter. You can also find information and tutorial videos Online at www.lechuza.co.uk

Shatterproof, UV resistant, frost proof. Suitable for both indoors and outdoors.

All Lechuza planters are 100% recyclable.
