

‘Marimo Moss Balls’

Aegagropila linnaei

The remarkable shape and appearance of Marimo may not seem natural, but these moss balls are formed in nature with no interference from humans whatsoever! Marimo moss balls are a highly unique and a rare form of algae growth. Marimo balls are regarded as good luck charms in Japan. Marimo balls are excellent for aquariums, but they can also be kept successfully in glass bowls, bottles, vases, and a variety of other containers.

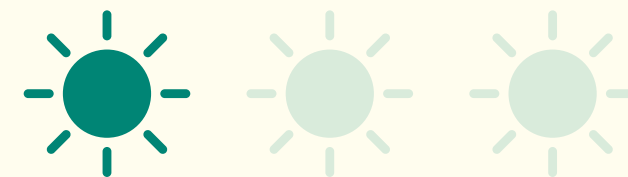

Sunlight: Normal household lighting or indirect sunlight provide enough light for Marimo to photosynthesize.

Water: Water changes are important for preventing dirt and waste from building up. We recommend a 50% water change every two weeks or so.

Temperature: Warm room temperature (75-80°F/24-27°C) during the day. Cooler (65-70°F/18-21°C) at night.

Top Tip: Rotate the moss balls in the water to help keep its round shape. You will also need to clean your moss balls from time to time. Take your Marimo out of the water and rinse it, followed by placing it in a container of clean water and gently squeezing the ball a few times.
