

'Golden Pothos'

Epipremnum pinnatum

Glossy, heart-shaped leaves are this plant's best feature. Scindapsus is well known for its long, trailing stems that can grow to 8 ft. Although it's usually grown as a trailing plant, it can easily be trained to climb a pole or frame. Cut them back a couple of times a year to keep the plant bushy and full. Cutting right above a leaf node (the place where the leaf is attached to the stem) will encourage the stem to branch out, giving you a fuller plant.

Sunlight: Low light to bright light. No direct sun. Although it will tolerate low light, it will have more leaves and better variegation if kept in bright light.

Water: Allow the top inch of soil to dry out in between watering. Yellow leaves are a sign of overwatering.

Humidity: Average room humidity.

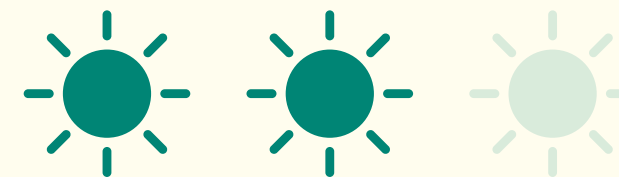

Temperature: Average to warm 60-80°F/16-27°C.

Feed: Feed once a month from spring through to autumn, with a balanced liquid fertilizer.

Repotting: This plant is fast growing so repot every 12 - 18 months. Check for roots sticking out of the drainage holes.

Top Tip: 'Golden Pothos' is a popular variety, variegated with yellow. 'Marble Queen' is heavily variegated with white. 'Jade' is dark solid green and 'Neon' has bright yellow-green leaves.
