Vine Weevil Damage in Pots & Containers

The vine weevil is a beetle that attacks a wide range of plants, particularly those grown in containers. It is one of the most common and devastating garden pests.

Adult weevils eat plant leaves during spring and summer, but the grubs cause the most damage over autumn and winter when they feed on plant roots, causing wilting and often plant death.

Provado Vine Weevil Killer is a systemic drench that can be used to protect against vine weevil damage from the start of the season, when plants are actively growing. It will also reduce the number of greenfly, blackfly and whitefly on your plants for between 4 and 6 weeks. Full effects can take up to two weeks after application, once the product has worked its way through the plant. The drench can be repeated every 4 months but only a maximum of 3 treatments can be done in one year. This product can also be used on houseplants. **It should not be used on edible plants or compost that is going to be planted with edible crops.**
